MEDICAL POLICY

SUBJECT: VISION THERAPY

POLICY NUMBER: 9.01.04
CATEGORY: Therapy/Rehabilitation

Clinical criteria used to make utilization review decisions are based on credible scientific evidence published in peer reviewed medical literature generally recognized by the medical community. Guidelines take into account physician society recommendations, the views of the physicians practicing in relevant clinical areas, the needs of the members in consultation with their providers, and other relevant factors to the extent practicable. Clinical criteria is reviewed and approved for use on an annual basis. Criteria are accessible to network providers, members, and prospective members upon request. Criteria may be verbally requested by calling 1 (800) 683-3781, or submitting a fax request to 1 (888) 273-8296. Requests may also be submitted in writing to P.O. Box 240, Pittsford, N.Y. 14534. Providers may also submit feedback regarding criteria by visiting www.yourcarehealthplan.com

• **If the member's subscriber contract excludes coverage for a specific service it is not covered under that contract. In such cases, medical policy criteria are not applied.**
• **Medical policies apply to commercial and Medicaid products only when a contract benefit for the specific service exists.**
• **Medical policies only apply to Medicare products when a contract benefit exists and where there are no National or Local Medicare coverage decisions for the specific service.**

POLICY STATEMENT:

I. Based upon our criteria and assessment of peer-reviewed literature, vision therapy that includes orthoptics and occlusion therapy, has been medically proven to be effective and is considered **medically appropriate** for the treatment of **amblyopia**.

II. Based upon our criteria and assessment of peer-reviewed literature, vision therapy that includes prism adaptation, has been medically proven to be effective and is considered **medically appropriate** when utilized for acquired **esotropia** prior to surgical intervention.

III. Based upon our criteria and assessment of peer-reviewed literature, vision therapy has been medically proven to be effective and is considered **medically appropriate** for the treatment of **convergence insufficiency**.

IV. Based upon our criteria and the lack of peer-reviewed literature, vision therapy has not been medically proven to be effective and is considered **investigational**, including but not limited to, the following indications:
   A. All other accommodative and vergence dysfunctions such as: fusional vergence dysfunction, divergence excess, convergence excess, divergence insufficiency, vertical phorias, basic exophoria, basic esophoria, accommodative insufficiency, sustained accommodation, accommodative infacility and spasm accommodation (see statement III above on coverage of convergence insufficiency).
   B. Low vision;
   C. Myopia;
   D. Nystagmus;
   E. Presbyopia;
   F. Strabismus, including esotropia (with the exception of acquired esotropia as stated above), and exotropia; and
   G. Age-related macular degeneration.

V. Based upon our criteria and assessment of the peer-reviewed literature, vision therapy does not improve patient outcomes and is **investigational** for **learning disabilities**; including Attention Deficit Hyperactivity Disorder (ADHD) and dyslexia.

DESCRIPTION:

Proprietary Information of YourCare Health Plan
Vision therapy (also known as visual therapy, visual training, vision training, eye training) involves a range of treatment modalities that includes the use of lenses, prisms, filters, optometric phototherapy (Syntonics), occlusion therapy (eye patching), behavioral modalities, and eye exercises (orthoptics, pleoptics). The therapeutic goal of vision therapy is to correct or improve specific visual dysfunctions. Dysfunctions that purportedly are treatable by vision therapy include amblyopia, strabismus, binocular, accommodative and convergence disorders as well as reading disorders such as dyslexia that are thought to be related to a lack of eye coordination. Vision therapy is performed in an optometrist’s or ophthalmologist’s office 1-2 times weekly for a number of months with additional home exercises done as reinforcement.

RATIONALE:

Most studies evaluating the efficacy of vision therapy for visual disorders are small. In general, these studies are poorly designed with significant methodological flaws, and the data derived from them are relatively weak and inconclusive. There is some evidence to support the use of vision therapy that involves occlusion as a treatment for amblyopia (treatment success with patching 72.3% -79%) and vision therapy that involves prism adaptation prior to surgery administered as a treatment for acquired esotropia (surgical success rates for prism adaption prior to surgery 89% versus 72% for patients receiving no prism therapy). Large, well-designed studies comparing vision therapy with other treatment modalities, standardization of outcome measurements and the criteria for defining patient selection criteria are needed to evaluate vision therapy for visual dysfunctions adequately.

A number of optometrists advocate vision therapy for patients with learning disabilities including dyslexia claiming that while vision therapy does not treat these disorders directly, it may improve visual efficiency and visual processing to allow the individual to be more responsive to educational instruction. This rationale for the use of vision therapy as a treatment for reading disabilities is unproven. While research suggests a relationship between oculomotor efficiency and reading skills, other studies have found that reading skills are related to language skills, and oculomotor ability is not the principal cause of reading disability. There is a scarcity of quality data on the efficacy of vision therapy for treating dyslexias and other reading and learning disabilities. Most of these study results were found to be inconsistent and the studies themselves were flawed by serious design limitations (e.g. small sample sizes, poorly defined patient criteria).
